What do we need? Download the free trial of CAD/CAM software from Mastercam. Full suite for anyone to. Windows 10 (version 20H2 or later) 64-bit Professional. Processor. 1. Field of the Invention The present invention generally relates to point of sale (POS) devices, and more specifically to a point of sale device in which a video camera is installed on a POS terminal platform to capture the image of the checkout procedure of the POS terminal. 2. Description of the Related Art In recent years, because of public interest in food hygiene, retailers have increasingly installed POS terminals at their stores so that customers may check the authenticity of food items. In addition, these POS terminals are operated by clerks. The clerk checks whether or not the items are properly taken out, and then sends the items into a plurality of bags in response to a checkout request signal. Furthermore, the clerk prints out receipts for the customers. However, as it is necessary to check items in the store for questionable ones, the processing time of items and the operation efficiency are poor. In addition, the need for labor greatly increases the labor cost. A POS terminal equipped with a video camera to capture the image of a checkout procedure so as to reduce the processing time of items and the operation efficiency has been proposed in, for example, Japanese Patent Laid-open Publication No. JP-2001-095755. In this POS terminal, after a person requesting for checkout has mounted a bag on the POS terminal, a video camera of the POS terminal captures an image of the person, who is transferring cash from his/her hand to the POS terminal, and compares the captured image with a preset image (template image) so as to check whether or not the cash taken out from the person's hand matches the preset cash. Then, the clerk can check the check-out request from the person requesting for checkout based on the result of the check. Thus, the processing time for the items is reduced, and the operation efficiency is improved. Furthermore, because the equipment cost required to operate the POS terminal is relatively low, the overall cost of the system can be reduced. In addition, if the POS terminal is equipped with an image storage means to record the image data in the bag, the image data may be used to check the image of the person taking out cash. However, the image data taken out from the bag usually contains noises because the image is taken by the video camera during the checkout. Therefore 82138339de
